PROFESSIONAL EXPERIENCE

Software Developer Intern **Feb 2026 – May 2026**

Riidl *Mumbai*

- Eliminated a class of file-handling failures across the production file pipeline by designing and shipping a structured Supabase storage layer with fault-tolerant error handling, replacing ad-hoc logic that had no retry or validation path.
- Restored full service reliability for active users during a live data-retrieval regression by tracing the failure to its root cause through systematic log analysis and deploying a fix before the issue escalated to a wider incident.
- Cut file upload and retrieval latency by 35% for production users by profiling the backend service layer, identifying the slowest query paths, and rewriting the bottlenecked functions.

Software Developer Intern **Dec 2024 – May 2025**

Thworks *Remote*

- Removed a fully manual data-entry process by building an automated scraping pipeline that collected and structured 500+ records across 3 leagues into PostgreSQL, served through a REST API to a Next.js frontend.
- Delivered pixel-accurate, production-ready cross-platform mobile apps on iOS and Android by translating Figma specs directly into React Native components over a 6-month engagement, with no dedicated design-QA handoff.
- Secured authenticated access for the full user base by integrating LinkedIn OAuth 2.0 into production mobile APIs, replacing an unauthenticated flow with a standards-based login system.

PROJECTS

LoopLearn - Python · Flask · React · PostgreSQL · GitHub Actions GitHub | Live

- Structured 50+ interdependent topics into a directed dependency graph in PostgreSQL to power prerequisite-based learning paths, served through a Flask API delivering daily content in text and audio.
- Removed manual publishing work entirely by building an automated scheduling pipeline for 100+ articles, deployed via a GitHub Actions CI/CD pipeline to Vercel and Render in parallel.
- Enabled a functioning paid tier without third-party auth platforms by implementing a Razorpay billing stack with webhook ingestion, idempotent payment-state handling, and access-control gating.

FormGen - Python · JSON Schema · ReactJS · PyPI GitHub | PyPI

- Published an open-source PyPI package that parses JSON Schemas and auto-generates fully typed React form components, supporting 8+ input types including nested objects, enums, and arrays.
- Cut form-development effort roughly in half for consuming engineers by building a modular validation engine (required, pattern, range rules) with dynamic, field-level error messaging.

Reachr - MongoDB · Express.js · React · Node.js GitHub | Live

- Automated an end-to-end outreach pipeline that discovers lookalike companies, identifies decision-makers, and assembles personalized outreach emails in under a minute per lead.
- Abstracted 4 external APIs (Hunter, Apollo, Prospeo, Ocean.io) behind a single pipeline interface for company discovery and contact enrichment, with Brevo wired in for delivery.

EDUCATION

Somaiya Vidyavihar University, Mumbai **Graduated 2026**

B.Sc. in Information Technology · CGPA: 9.28 / 10.0

TECHNICAL SKILLS

Languages: Python, JavaScript, TypeScript, SQL, Java, C++, C#

Backend: Node.js, Express.js, Flask, REST API Design, OAuth 2.0, Webhook Handling

Frontend: React.js, Next.js, React Native

Databases: PostgreSQL, MySQL, MongoDB, Supabase

Tools & Infra: Git, GitHub Actions (CI/CD), Docker, AWS, Vercel, Render, Postman, Jira, Code Reviews

Testing: Playwright, Selenium

Other: Data Pipelines, Web Scraping, Idempotent Job Design, Fault-tolerant Workflows, Root-Cause Debugging
